

Hydrogen, made where the drone lands.

On-site hydrogen refueling for drone fleets in the field

The problem

Hydrogen drones fly 3 to 5 times longer than battery drones, but their fuel is made far away and shipped to the forward position in cylinders, swapped in, and shipped back. It is a resupply convoy: slow, exposed, and hard to sustain at operational tempo.

The solution

A field-deployable unit that generates hydrogen on site from water and available power, compresses it to 350 bar, and fills the drone tank directly. No hydrogen shipped in, no cylinder swap, no convoy.

10–25 kg/day

modular H₂ output

350 bar

fill pressure

< 5 min

fill time per drone

Flexible power

generator, grid or solar

Refuel Node TRN-10, v1 design targets. Trailer or skid, 2.6 × 1.3 m.

Traction

- 3 target customers approached, 1 in discussion; in-person meeting in October. No LoI or revenue yet
- 11 supplier quotes in hand (20 requested)
- Vienna Founders Residency; build base in Munich
- Speaker, Hydrogen & Fuel Cell Summit, Frankfurt, Feb 2027

Why it works

- Hydrogen drones are entering service: in combat in Ukraine since December 2025, on the US DIU Blue UAS Select list
- Competitors confirm the category (EHOSS, HyTEC, H3 Dynamics); we compete on detachment-sized fit and speed to a pilot
- Water plus power: no reagent or tank delivery to resupply, but power draw is real (about 600 kWh/day at full output)
- Built on sourced industrial stacks and compressors, not a lab prototype scaled up

Where we are

In-house PEM electrolysis bench prototype (photos below) works (6 NL/h at 14 bar, filtration, two-stage compression). The production electrolyzer modules and 350 bar compressor are sourced from established suppliers. Not yet done: purity test, 350 bar integration, tank interface, ruggedization (MIL-STD-810 design goal), certification and a field pilot, which the round funds.

The ask

€750K at €7.5M post-money (10%)

Delivers: a signed LoI or pilot order, a 350 bar fill into a real drone tank, an environmental test report and a field pilot. Also welcome: introductions to drone operators and defense procurement, and non-dilutive funding leads.
